Preface	xi
1. Principal Component Analysis	1
1.1 Data, Notations	1
1.2 Why Analyse a Table with PCA?	2
1.3 Clouds of Individuals and Variables	3
1.4 Centring and Reducing	7
1.5 Fitting Clouds N_I and N_K	7
1.5.1 General Principles and Formalising Criteria	8
1.5.2 Interpreting Criteria	9
1.5.3 Solution	10
1.5.4 Relationships Between the Analyses of the Two Clouds	12
1.5.5 Representing the Variables	14
1.5.6 Number of Axes	15
1.5.7 Vocabulary: Axes and Factors	15
1.6 Interpretation Aids	16
1.6.1 Percentage of Inertia Associated with an Axis	16
1.6.2 Contribution of One Point to the Inertia of an Axis	17
1.6.3 Quality of Representation of a Point by an Axis	17
1.7 First Example: 909 Baccalaurate Candidates	18
1.7.1 Projected Inertia (Eigenvalues)	18
1.7.2 Interpreting the Axes	19
1.7.3 Methodological Remarks	22
1.8 Supplementary Elements	23
1.9 Qualitative Variables in PCA	26
1.10 Second Example: Six Orange Juices	29
1.11 PCA in FactoMineR	31
2. Multiple Correspondence Analysis	39
2.1 Data	39
2.2 Complete Disjunctive Table	40
2.3 Questioning	41
2.4 Clouds of Individuals and Variables	42
2.4.1 Cloud of Individuals	43
2.4.2 Cloud of Categories	45
2.4.3 Qualitative Variables	46

2.5	Fitting Clouds N_I and N_K	48
2.5.1	Cloud of Individuals	48
2.5.2	Cloud of Categories	50
2.5.3	Relationships Between the Two Analyses	51
2.6	Representing Individuals, Categories and Variables	53
2.7	Interpretation Aids	54
2.8	Example: Five Educational Tools Evaluated by 25 Students	55
2.8.1	Data	55
2.8.2	Analyses and Representations	57
2.8.3	MCA/PCA Comparison for Ordinal Variables	59
2.9	MCA in FactoMineR	61
3.	Factorial Analysis of Mixed Data	67
3.1	Data, Notations	67
3.2	Representing Variables	68
3.3	Representing Individuals	69
3.4	Transition Relations	70
3.5	Implementation	72
3.6	Example: Biometry of Six Individuals	72
3.7	FAMD in FactoMineR	74
4.	Weighting Groups of Variables	79
4.1	Objectives	79
4.2	Introductory Numerical Example	81
4.3	Weighting Variables in MFA	82
4.4	Application to the Six Orange Juices	86
4.5	Relationships with Separate Analyses	88
4.6	Conclusion	90
4.7	MFA in FactoMineR (First Results)	91
5.	Comparing Clouds of Partial Individuals	101
5.1	Objectives	101
5.2	Method	103
5.3	Application to the Six Orange Juices	106
5.4	Interpretation Aids	107
5.5	Distortions in Superimposed Representations	110
5.5.1	Example (Trapeziums Data)	110
5.5.2	Geometric Interpretation	112
5.5.3	Algebra Approach	114
5.6	Superimposed Representation: Conclusion	116
5.7	MFA Partial Clouds in FactoMineR	116
6.	Factors Common to Different Groups of Variables	121
6.1	Objectives	121
6.1.1	Measuring the Relationship Between a Variable and a Group	122

6.1.2	Factors Common to Several Groups of Variables	123
6.1.3	Back to the Six Orange Juices	123
6.1.4	Canonical Analysis	125
6.2	Relationship Between a Variable and Groups of Variables	126
6.3	Searching for Common Factors	127
6.4	Searching for Canonical Variables	128
6.5	Interpretation Aids	129
6.5.1	L_g Relationship Measurement	129
6.5.2	Canonical Correlation Coefficients	130
7.	Comparing Groups of Variables and Indscal Model	133
7.1	Cloud N_j of Groups of Variables	133
7.2	Scalar Product and Relationship Between Groups of Variables	135
7.3	Norm in the Groups' Space	139
7.4	Representation of Cloud N_j	139
7.4.1	Principle	139
7.4.2	Criterion	142
7.5	Interpretation Aids	142
7.6	The Indscal Model	144
7.6.1	Model	144
7.6.2	Estimating Parameters and Properties	146
7.6.3	Example of an Indscal model via MFA (cards)	148
7.6.4	Ten Touraine White Wines	151
7.7	MFA in FactoMineR (groups)	155
8.	Qualitative and Mixed Data	159
8.1	Weighted MCA	159
8.1.1	Cloud of Categories in Weighted MCA	160
8.1.2	Transition Relations in Weighted MCA	160
8.2	MFA of Qualitative Variables	162
8.2.1	From the Perspective of Factorial Analysis	162
8.2.2	From the Perspective of Multicanonical Analysis	163
8.2.3	Representing Partial Individuals	165
8.2.4	Representing Partial Categories	166
8.2.5	Analysing in Space of Groups of Variables (\mathbb{R}^{I^2})	166
8.3	Mixed Data	168
8.3.1	Weighting the Variables	168
8.3.2	Properties	169
8.4	Application (Biometry2)	172
8.4.1	Separate Analyses	172
8.4.2	Inertias in the Overall Analysis	174
8.4.3	Coordinates of the Factors of the Separate Analyses	175
8.4.4	First Factor	176
8.4.5	Second Factor	180

8.4.6	Third Factor	180
8.4.7	Representing Groups of Variables	181
8.4.8	Conclusion	183
8.5	MFA of Mixed Data in FactoMineR	183
9.	Multiple Factor Analysis and Procrustes Analysis	189
9.1	Procrustes Analysis	189
9.1.1	Data, Notations	189
9.1.2	Objectives	190
9.1.3	Methods and Variations	190
9.2	Comparing MFA and GPA	192
9.2.1	Representing N_i^j	192
9.2.2	Mean Cloud	193
9.2.3	Objective, Criterion, Algorithm	193
9.2.4	Properties of the Representations of N_i^j	195
9.2.5	A First Appraisal	195
9.2.6	Harmonising the Inertia of N_i^j	196
9.2.7	Relationships Between Homologous Factors	196
9.2.8	Representing Individuals	197
9.2.9	Interpretation Aids	198
9.2.10	Representing the Variables	199
9.3	Application (Data 2^{3-1})	199
9.3.1	Data 2^{3-1}	199
9.3.2	Results of the MFA	201
9.3.3	Results of the GPA	203
9.4	Application to the Ten Touraine Wines	206
9.5	Conclusion	207
9.6	GPA in FactoMineR	208
10.	Hierarchical Multiple Factor Analysis	211
10.1	Data, Examples	211
10.2	Hierarchy and Partitions	212
10.3	Weighting the Variables	214
10.4	Representing Partial Individuals	215
10.4.1	Method	215
10.4.2	Application to the Six Orange Juices	217
10.5	Canonical Correlation Coefficients	219
10.6	Representing the Nodes	220
10.7	Application to Mixed Data: Sorted Napping®	221
10.7.1	Data and Methodology	221
10.7.2	Intermediary Analysis: MFA on a Sorted Nappe	223
10.7.3	Decompositions of Inertia	225
10.7.4	Representing Partial and Mean Individuals	226
10.8	HMFA in FactoMineR	231

11. Matrix Calculus and Euclidean Vector Space	239
11.1 Matrix Calculus	239
11.2 Euclidean Vector Space	243
11.2.1 Vector Space Endowed with the Usual Distance	243
11.2.2 Euclidean Space Endowed with a Diagonal Metric	245
11.2.3 Visualising a Cloud in a Space Endowed with a Metric Different from the Identity	246
Bibliography	249
